## Introduction

The study of intimate partner violence (IPC) can have an influence on research participants as they reflect on their own life experiences. In the context of a quantitative, longitudinal study of IPV, 42 women qualitatively described their life experiences during their 12 weeks on the study. Our aim was to examine the impact of study participation, and enrich our quantitative findings.

## Results

Participants' average age was 38; average duration of violence was 7 years. 71% were Hispanic; half reported annual household income of \$20,000 or less.

## Methods

**Participants.** Researchers recruited 200 women from 6 primary care clinics. Participants were 18-64 years old, living with a male partner for  $\geq$  6 months, and experiencing verbal or physical abuse within the past 30 days.

**Measurement.** Participants completed a baseline questionnaire and, for 12 weeks, made daily calls to an automated telephone survey which assessed stressors and IPV. A weekly phone call to a researcher assessed safety and adverse life events. At end-of-study, researchers interviewed 42 participants about their experiences during the study. Interviews were transcribed and analyzed using qualitative methods.

## Conclusion

Participation on the study caused no increased risk to safety for these women and may have provided benefit in the form of insight, emotional support, and access to resources.

I said all I had to do is push this button and the police would be here - 8640</i></p> <p><i>[I called] when I was at school, waiting for a class or... before bed and he'd be watching TV. Most of the time he wasn't there. -8448</i></p>
